The Early Years

The Apple II was first introduced in 1977 by Steve Wozniak and Steve Jobs. The machine was initially designed as a hobby project, but it quickly became clear that the Apple II had the potential to be a commercial success. The Apple II was one of the first personal computers to feature a color display, and it was also one of the first computers to be able to run

software from a floppy disk. These features made the Apple II a very popular machine, and it quickly became one of the best-selling personal computers in the world.

The Golden Age

The Apple II reached its peak of popularity in the early 1980s. During this time, the Apple II was used in schools, businesses, and homes all over the world. The Apple II was also used to develop some of the most popular software programs of the time, including VisiCalc, WordStar, and AppleWorks. The Apple II was a major force in the development of the personal computer industry, and it helped to make personal computing accessible to millions of people.
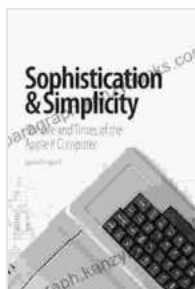

The Decline

The Apple II began to decline in popularity in the late 1980s and early 1990s. The Apple II was facing competition from newer, more powerful personal computers, such as the IBM PC and the Macintosh. The Apple II was also beginning to show its age, and it was no longer able to keep up with the latest advances in technology. In 1993, Apple finally discontinued production of the Apple II.

The Legacy

The Apple II may no longer be in production, but its legacy lives on. The Apple II was one of the most important personal computers of all time, and it helped to shape the future of technology. The Apple II paved the way for the Macintosh, and it also helped to create the market for personal computers that we know today. The Apple II is a reminder of how far the

personal computer industry has come, and it serves as a testament to the power of innovation.
